Industrial Estate,
Shepley Lane Marple SK6 7JW

Where to use

Perfect at removing un-cured cementitious grout residue from tiles.

Benefits

- ✓ Rapid drying
- ✓ Used at the installation stage
- ✓ Does not damage grout joints
- ✓ Use indoors and outdoors, on floors and vertical surfaces
- ✓ Does not emit harmful fumes

How to use

Once the grout has started to cure, according to the manufacture's instructions (normally 10 - 30 minutes), carry out an initial test clean to the surface with a damp sponge, then proceed with the final cleaning. Spray First wash grout remover evenly over the surface. Allow to react for 1-2 minutes, depending on the type of material. Clean using a damp cloth. For stubborn residue, repeat the above instructions after one hour. Refer to the grout manufacture's instructions for indication about when the surface is ready for traffic.

Caution: Do not use on acid sensitive material. Do not use abrasive sponges. Always test the product before use to determine the material's resistance and the waiting time required for the product to reach maximum effectiveness.
